

KAY — AI Fashion Assistant

Product Requirements Document (PRD)

Company: ABOUT YOU

Platform: Mobile app

Product type: AI-powered conversational fashion assistant and recommender

MVP build tool: Lovable

1. Product & Context

Company type: ABOUT YOU is a fashion e-commerce platform operating a mobile-first shopping experience.

Product context: This project focuses on KAY, ABOUT YOU's existing Chat Support, and explores expanding it into conversational product discovery and fashion recommendations.

Target users: Mobile fashion shoppers who either roughly know what they want or need guidance deciding what products would suit a particular need, style, occasion, or budget.

2. Product Vision

KAY will extend its existing customer-support role into a conversational shopping assistant that **helps users discover and choose fashion products through natural language.**

Users can either:

- describe what they roughly want, or
- ask KAY for guidance when they are unsure what would work.

KAY then interprets the shopper's requirements and context, recommends relevant products, explains why they match, and allows the user to refine recommendations conversationally.

The core experience is:

Ask → Understand → Recommend → Explain → Refine → View Product → Add to Bag

About You
KAY - AI Conversational Fashion Assistant & Recommender Feature

The MVP will test whether conversation can become a useful alternative entry point to traditional search and filters.

3. Competitor Analysis

Three competitors were selected because they represent different approaches to the same emerging problem space: AI-assisted product discovery, conversational shopping, and fashion recommendation.

The analysis helps identify which capabilities are becoming common in AI shopping experiences and where KAY could create differentiated value within the ABOUT YOU ecosystem.

Daydream — AI Fashion Shopping

Daydream is an AI-powered fashion shopping platform focused on helping shoppers discover fashion products through natural-language requests and personalized discovery.

It represents the **fashion-specialist** end of the competitive landscape.

Strength:

Fashion-focused conversational discovery enables shoppers to express needs around style, occasion, colour, budget and other preferences naturally rather than relying only on traditional search and filters.

Opportunity for KAY:

KAY can bring similar conversational fashion discovery **directly into the existing ABOUT YOU shopping journey**, connecting recommendations with ABOUT YOU products, product details and commerce actions without requiring the shopper to move to a separate discovery destination.

Amazon Rufus — AI Shopping Assistant

Amazon Rufus is a generative AI shopping assistant integrated into Amazon's shopping experience. It supports conversational product discovery, product questions, comparisons and recommendations across a broad range of categories.

It represents the **embedded conversational-commerce assistant** model.

Strength:

Rufus demonstrates how conversational AI can support product research and decision-making directly within a large ecommerce platform.

Opportunity for KAY:

Because KAY is focused specifically on fashion, it can explore deeper fashion context such as **occasion, aesthetic, styling preferences, fit and complementary products**, rather than addressing shopping across every product category.

Google Shopping AI — AI-Assisted Shopping & Discovery

Google's AI-powered shopping experiences use natural-language and AI-assisted discovery to help shoppers search for, evaluate and visualize products across a broad commerce ecosystem.

It represents the **AI-powered cross-retailer discovery** model.

Strength:

Google combines broad product discovery with a large shopping ecosystem, helping users explore products across retailers.

Opportunity for KAY:

KAY can provide a more contained fashion journey in which **conversation → recommendations → refinement → product detail → Add to Bag** can remain within the ABOUT YOU experience.

What the Competitive Landscape Suggests

Across these different approaches, several patterns support the hypotheses identified during discovery:

Conversational discovery is emerging

Shopping experiences are increasingly allowing users to express needs in natural language rather than relying exclusively on keywords and filters.

Recommendations need to connect to products

The value of the assistant increases when conversation leads to actionable, shoppable recommendations rather than text advice alone.

Context creates an opportunity for specialization

General shopping assistants can serve many categories, while a fashion-focused assistant can potentially reason around occasion, style, colour, fit and complementary products.

Integration matters

Embedding assistance inside an existing commerce journey can reduce the gap between discovering a product and acting on the recommendation.

Competitive hypothesis: KAY's opportunity is not simply to add another AI chatbot, but to combine conversational fashion guidance with ABOUT YOU's existing product and shopping ecosystem.

Our Positioning — How KAY Is Different

KAY extends the existing ABOUT YOU assistant from customer support into conversational fashion discovery, while retaining its current support role.

KAY is designed around two shopping moments identified during discovery:

“I know roughly what I want”

“Suggest beige trousers for a summer day party.”

The shopper has partial requirements and wants relevant products quickly.

“I need guidance”

“Help me find something for a date night.”

The shopper knows the situation but needs help deciding what could work.

In both cases, KAY can understand the shopper's intent and relevant context, recommend products, explain why they match and allow the shopper to refine recommendations conversationally.

Core Journey

**Ask → Understand → Recommend → Explain → Refine → View Product →
Add to Bag → Buy**

This keeps conversational discovery connected to the existing ABOUT YOU commerce journey.

Fit assistance, Body Scan, Virtual Try-On and other advanced integrations can complement this experience in later phases without being required for the core conversational MVP.

Positioning Statement

KAY brings conversational fashion guidance directly into the ABOUT YOU shopping journey, helping shoppers move from “what do I need?” to relevant, explainable and shoppable recommendations with less effort.

4. User Persona & Jobs-To-Be-Done

Primary Persona — Lea

Name: Lea

Age: 27

Role: Young professional and frequent mobile fashion shopper

Context

Lea enjoys shopping for fashion and lifestyle products online. She often starts shopping with a **general need, occasion, or idea rather than an exact product specification.**

Sometimes she roughly knows what she wants, such as beige trousers for a summer party. At other times, she knows the situation but wants guidance, such as finding an outfit for a date night.

Goal

Find products that match her needs, style, and situation quickly, with enough guidance to feel confident about her choice.

Pain Points

- **Manual search and filtering takes effort:** Lea has to translate what she has in mind into categories and filters and then browse and compare multiple products.

About You

KAY - AI Conversational Fashion Assistant & Recommender Feature

- **She doesn't always know exactly what to search for:** Sometimes she knows the occasion or outcome she wants but needs help deciding which products would work.

What Lea Needs from KAY

Lea wants to describe what she needs in her own words, receive relevant recommendations, understand **why** they match, and refine the results conversationally.

For example:

“Help me find an outfit for a date night.”

“Suggest beige trousers for a summer day party.”

“I like this one, but show me something more casual.”

Jobs-To-Be-Done (JTBD)

When I know roughly what I need or the situation I'm shopping for, I want to describe it naturally and receive relevant recommendations, so that I can find suitable products without spending time manually searching, filtering, and comparing many options.

Persona Assumption

Lea is a **working MVP persona** based on the identified problem and target-user hypothesis. Her needs and pain points should be validated through real user research and discovery interviews rather than treated as established ABOUT YOU customer research.

5. Requirements & MVP Scope

Epics & User Story Titles

The MVP will test whether shoppers can use **natural conversation to move from a shopping need or fashion question to relevant, explainable and shoppable product recommendations.**

Epics & User Story Titles

E1 — Conversational Shopping Entry

About You

KAY - AI Conversational Fashion Assistant & Recommender Feature

- Start conversation with suggested prompts
- Enter a shopping request using free-text chat

E2 — Intent & Context Understanding

- Understand shopping intent, preferences and constraints
- Ask smart clarification when needed
- Use or override basic shopper preferences when available

E3 — Product Catalogue & Availability

- Connect to the ABOUT YOU product catalogue
- Access live product pricing and availability

E4 — Product Recommendations

- Recommend relevant real products
- Display visual, clickable product cards
- Explain why each product matches the shopper's needs

E5 — Conversational Refinement & Context Retention

- Refine recommendations conversationally
- Retain relevant context during the active conversation

E6 — Fashion & Occasion Guidance

- Provide simple fashion and styling guidance
- Recommend products based on occasion and practical needs

E7 — Product Discovery to Purchase

- View recommended product details
- Add selected product to Bag
- Return to KAY without losing the active conversation

Phase 2 — Next

E8 — Advanced Recommendations & Comparison

- Improve recommendation ranking
- Compare recommended products

About You
KAY - AI Conversational Fashion Assistant & Recommender Feature

- Recommend advanced outfits and complementary products

E9 — Image & Multimodal Discovery

- Discover products using an uploaded image
- Use image and text together for basic multimodal styling

E10 — Shopping Experience Integrations

- Integrate Body Scan
 - Integrate Virtual Try-On
 - Integrate with ABOUT YOU account capabilities
-

Phase 3 — Later

E11 — Persistent Personalization & Style Profile

- Save and manage style preferences with consent
- Access conversation history
- Learn from interactions across sessions
- Build an evolving personal style profile

E12 — Advanced Multimodal Interaction

- Provide advanced multimodal styling
- Interact with KAY using voice

E13 — Advanced Personalized Recommendations

- Provide advanced personalized recommendation ranking

MVP Scope Summary

KAY retains its existing customer-support capabilities while the MVP extends the experience into conversational fashion discovery and product recommendations.

The MVP focuses on demonstrating one complete conversational shopping journey:

**Ask → Understand → Recommend → Explain → Refine → View Product →
Add to Bag → Buy**

Build Now — MVP

- E1 — Conversational Shopping Entry
- E2 — Intent & Context Understanding
- E3 — Product Catalogue & Availability
- E4 — Product Recommendations
- E5 — Conversational Refinement & Context Retention
- E6 — Fashion & Occasion Guidance
- E7 — Product Discovery to Purchase

Next

- E8 — Advanced Recommendations & Comparison
- E9 — Image & Multimodal Discovery
- E10 — Shopping Experience Integrations

Later

- E11 — Personalization & Style Profile
- E12 — Advanced Multimodal Interaction
- E13 — Advanced Personalized Recommendations

Explicitly Out of Scope for MVP

About You
KAY - AI Conversational Fashion Assistant & Recommender Feature

- Building or replacing checkout and payment functionality
 - Building new Body Scan technology
 - Building new Virtual Try-On technology
 - Production recommendation infrastructure
 - Rebuilding or redesigning KAY's existing customer-support functionality
-

6. Success Metrics

MVP success will be measured by whether KAY's recommendations help shoppers **progress from product discovery toward purchase intent**.

1. AI Recommendation Purchase Rate — Primary Metric

What we measure:

The percentage of users who purchase at least one product recommended by KAY.

How we measure it:

$\text{Users who purchase} \geq 1 \text{ KAY-recommended product} \div \text{Users who receive KAY product recommendations} \times 100$

What good looks like for the MVP:

At least 20% of test users who receive KAY recommendations purchase a recommended product.

Why it matters:

This measures whether KAY is helping users discover products they actually want to buy, rather than simply generating engagement.

2. Recommendation CSAT — Secondary Metric

What we measure:

The percentage of users who indicate that KAY's recommendations were helpful.

After recommendations, users are asked:

“Was this recommendation helpful?” 👍 / 👎

About You
KAY - AI Conversational Fashion Assistant & Recommender Feature

How we measure it:

 responses ÷ ( +  responses) × 100

What good looks like for the MVP:

At least 70% Recommendation CSAT.

Why it matters:

This provides a direct signal of perceived recommendation quality, including cases where a recommendation was helpful but did not ultimately result in a purchase.

7. Risks & Dependencies

1. Recommendation Quality

Risk: Fashion preferences are subjective, so recommendations may match product attributes but still feel irrelevant to the shopper.

Mitigation: Use conversational refinement, recommendation feedback, and quality monitoring to continuously evaluate and improve relevance.

2. AI Reliability & Scalability

Risk: AI responses may be inaccurate, inconsistent or too slow, particularly as KAY moves from controlled testing to real customer usage.

Mitigation: Apply AI guardrails, monitor errors and response performance, and use progressive rollout from Closed Beta before scaling to a broader audience.

3. Conversational Friction

About You

KAY - AI Conversational Fashion Assistant & Recommender Feature

Risk:

KAY may ask too many clarification questions or provide responses that are too long, making conversational shopping slower than traditional search.

Mitigation:

Use progressive clarification, ask only questions that materially improve recommendation relevance, keep responses concise, and validate conversational flow through prototype usability testing.

This is particularly relevant because **we've already encountered exactly this issue in the prototype** with information appearing too quickly and conversation becoming heavy.

4. Product Data & Commerce Integration

Dependency: KAY depends on reliable access to the ABOUT YOU product catalogue, live pricing and availability, and existing commerce services such as Product Detail and Add to Bag.

Mitigation: Validate API availability, product-data accuracy and commerce integration before Closed Beta, with monitoring during rollout. .

Dependency	Why
ABOUT YOU Product Catalogue / APIs	KAY needs access to real products and attributes to generate recommendations.
Live Pricing & Availability Data	KAY needs accurate price, size and stock information so it doesn't recommend unavailable or incorrectly priced products.
Commerce / Add-to-Bag Integration	The KAY MVP journey reaches Add to Bag and relies on existing ABOUT YOU commerce infrastructure for the subsequent checkout and purchase journey.

About You
KAY - AI Conversational Fashion Assistant & Recommender Feature

AI / LLM Service

KAY depends on the AI layer to understand requests, maintain context, clarify needs and generate explanations.

8. Responsible AI / Guardrails

KAY uses AI to understand natural-language shopping requests, ask relevant clarification questions, and provide fashion guidance and product recommendations based on available ABOUT YOU product information.

For the MVP, the following guardrails apply:

- **AI transparency:** Users are informed that KAY is an AI-powered assistant and that recommendations are AI-generated based on the preferences and context they provide.
- **Explainable recommendations:** KAY provides a short “Why this matches” explanation based on the user’s stated requirements, such as occasion, colour, budget, style, or practical need.
- **No invented product information:** KAY recommends only products available in the ABOUT YOU catalogue and should not fabricate prices, availability, product attributes, or capabilities.
- **User remains in control:** Recommendations are suggestions. Users can refine, reject, or ignore them, and KAY should not pressure users into purchasing a product.
- **Consent for personal images and video:** KAY must obtain clear user consent before accessing, processing, or using personal images or video for features such as image-based discovery, multimodal styling, Body Scan, or Virtual Try-On. Users should understand why the media is being used and remain in control of whether they provide it.
- **Sensitive information is not required:** KAY should not request unnecessary sensitive personal information to provide fashion recommendations.

User Disclosure

A simple disclosure can be shown within the KAY experience:

About You

KAY - AI Conversational Fashion Assistant & Recommender Feature

“KAY uses AI to provide shopping suggestions based on the preferences and context you share. Recommendations may not always perfectly match your preferences.”

9. Security & Privacy — MVP

KAY will follow a **data-minimization approach**, using only the information necessary to provide the conversational shopping experience.

- **Minimal personal data:** KAY should not request unnecessary personal information such as addresses, payment details, or other sensitive information to provide fashion recommendations.
- **Conversation data:** Conversation data should only be collected, processed, and retained where necessary for the KAY experience, analytics, safety, or agreed product purposes, with appropriate retention and access controls.
- **Consent for personal images and video:** Personal images or video used for image-based discovery, multimodal styling, Body Scan, or Virtual Try-On require clear user consent before processing. Users should understand the purpose of the processing and remain in control of whether they use these features.
- **Optional image/body-based features:** Body Scan, Virtual Try-On, and other image-based capabilities remain optional. Users can use KAY's core conversational recommendations without providing personal images or body-related data.
- **Account & shopping data:** Where KAY interacts with ABOUT YOU account or shopping data, access should be limited to what is necessary for the requested experience and protected through appropriate authentication and access controls.

Production Considerations

Before broader rollout, KAY should undergo appropriate privacy and security review covering conversational data, account information, saved preferences, personal images/video, consent, access controls, data retention and deletion, and compliance with applicable privacy requirements.

10. Roadmap & Launch plan

KAY develops from a **core conversational shopping MVP** into an increasingly capable and personalized fashion assistant.

Core journey across all phases:

Ask → Understand → Recommend → Explain → Refine → View Product → Add to Bag

Progression and rollout depend on user validation, recommendation quality, technical reliability, Responsible AI, privacy and security.

-Indicative timeline — subject to technical discovery, integration complexity and validation outcomes.

Phase 1 — MVP: Conversational Fashion Discovery

0–6+ Weeks | Prototype → MVP → Closed Beta

Goal:

Validate whether conversational fashion discovery helps shoppers find, refine and purchase relevant ABOUT YOU products.

Build

- Conversational Shopping Entry
- Intent & Context Understanding
- Product Catalogue & Availability
- Product Recommendations
- Conversational Refinement & Context Retention
- Fashion & Occasion Guidance
- Product Discovery to Purchase

Launch & Validation

- Prototype → MVP → ~1% Closed Beta

Validation focus:

Can shoppers move from a natural-language fashion need to a relevant recommendation, add it to Bag, and ultimately purchase through the existing ABOUT YOU checkout journey?

Phase 2 — Enhanced Shopping Experience

Months 2–4 | Improve → Expand → Multimodal

Goal:

Improve recommendation quality, expand KAY's shopping capabilities and progressively scale the validated experience.

Build

- Advanced Recommendations & Comparison
- Image & Multimodal Discovery
- Shopping Experience Integrations

Launch

- ~1% → **5–10%**: Expand after successful Closed Beta validation.

Validation focus:

Does KAY maintain or improve recommendation quality and shopping outcomes as capabilities and user exposure increase?

Phase 3 — Personalized Fashion Assistant

Months 4–8+ | Scale → Personalize → Broader Launch

Goal:

Scale the validated KAY experience while introducing consent-based personalization and advanced interaction capabilities.

Build

- Personalization & Style Profile
- Advanced Multimodal Interaction
- Advanced Personalized Recommendations

Launch

- ~50% → **Broader Rollout** .

About You
KAY - AI Conversational Fashion Assistant & Recommender Feature

Validation focus:

Can KAY scale while delivering increasingly relevant and personalized fashion assistance without compromising trust, privacy, recommendation quality or reliability?

Cross-Cutting Tracks

🛡️ **Responsible AI, Privacy & Security — All Phases:** AI transparency, product accuracy, user control, data minimization and consent apply throughout development and rollout.

📊 **Analytics, Testing & Validation — All Phases:** Validation progresses from MVP testing and feedback → beta analytics/A-B testing → scaled performance and personalization monitoring.

Proposed Launch Progression

Prototype → Internal Validation → Functional MVP → ~1% Closed Beta → und5–10% → ~25% → ~50% → Broader Rollout

◇ Validation Gates

Progress to the next rollout stage only when agreed thresholds are met for:

User Value · Recommendation Quality · Product/Data Accuracy · Technical Reliability · Responsible AI · Privacy & Security

 **Future Opportunities — Explore after core roadmap validation**

Smart Wardrobe · Wardrobe-Aware Outfit Bundling · Celebrity/Influencer Style Inspiration · Social Sharing & Co-Shopping

About You

KAY - AI Conversational Fashion Assistant & Recommender Feature

1. Wardrobe-Aware Styling & Mix-Match

Create complete outfits combining **owned wardrobe items with recommended products**, showing multiple ways a new item could work with what the shopper already owns.

Example: "This blazer works with three pieces you already own. Here are three outfit combinations."

2. Celebrity & Influencer Style Inspiration

Allow shoppers to describe a celebrity/influencer aesthetic or request looks inspired by a particular style, then recommend relevant ABOUT YOU products that capture similar characteristics.

Example: "I love Zendaya's style. Show me pieces with a similar aesthetic."

3. Social Sharing & Co-Shopping

Allow shoppers to share KAY recommendations or outfits with friends, collect feedback, and potentially shop collaboratively.

Example: Share a KAY-generated date-night look and ask friends to vote between two options.
